

## How AnyDesk works?

### How does it work?

AnyDesk works by establishing a remote connection between two devices, one acting as the host and the other as the client. Here are the general steps of how it works:

1. **Download and Install:** The host needs to download and install the AnyDesk software on their computer or device. The client also needs to have AnyDesk installed on their device.
2. **Connect:** The client enters the AnyDesk address (a unique ID provided by the host) in the AnyDesk app on their device and clicks on the "Connect" button.
3. **Authentication:** AnyDesk provides two-factor authentication for enhanced security. The client needs to enter a password to access the remote device.
4. **Remote Access:** Once the authentication is successful, the client can access the remote device's desktop, files, folders, and applications.
5. **Control:** The client can control the remote device as if they were physically present in front of it. They can use their mouse and keyboard to navigate and operate the remote device.
6. AnyDesk uses proprietary DeskRT video codec to provide high-quality video and audio transmission with low latency. The software also uses encryption technology to

#### TASK: Work in pairs

1. Download and Install on your PC AnyDesk
2. Get the HostID from your partner and try to connect on his/her PC
