

Exercise 6

DO IT BETTER

Have you ever said when using something that you could do it better? Now is the perfect time for that!

The following method consists of noticing flaws and things to improve in well-known objects. You have to remember not to upgrade the whole item at once. We should symbolically disassemble the object into its first parts and indicate the elements that could look different.

What can we improve?

- physical parameters (length, weight, color),
- functions (an object may have several functions),
- features not resulting from the function, but from the designers' habits, e.g. modernization of a product that has been similarly made for many years,
- the mutual arrangement of the components of the object (do they interfere with each other?).

EXERCISE:

Take a close look at the selected item/object. See what you don't like about it, what its shortcomings are. Try to see what features or elements could be improved.

Symbolically disassemble this item into its first parts and try to improve them.
